

E-Learning Platform Purchase Analysis – Summary Report

Project Overview

This project analyzes purchase data from an online e-learning platform using MySQL. The database contains three tables: learners, courses, and purchases. SQL joins, aggregation functions, and filtering techniques were used to analyze learner behavior, course popularity, and revenue trends.

Descriptive Insights:

- Analytics and Programming courses had the highest number of purchases.
- Some learners spent more on courses, showing higher engagement with the platform.
- Several learners purchased courses from multiple categories.
- Certain courses had low or no purchases.

Diagnostic Insights:

- Technical and career-oriented courses are more popular due to high industry demand.
- Learners interested in skill development purchased courses from multiple categories.
- Low-performing courses may have lower visibility or lower learner interest.

Predictive Insights:

- Demand for Analytics and Programming courses may continue increasing in the future.
- Personalized recommendations and bundle offer may increase multi-category purchases.
- Courses with low purchases may continue underperforming without proper promotion.

Recommendations:

- Focus marketing campaigns on top-performing categories such as Analytics and Programming.
- Introduce personalized course recommendations based on learner interests.
- Offer bundled discounts to encourage multi-category purchases.
- Improve promotion for low-performing courses.
- Monitor learner behavior regularly to identify future sales trends.

Conclusion:

This project demonstrates how MySQL can be used to analyze e-learning purchase data and generate business insights. The analysis helps understand learner behavior, course performance, and future opportunities for improving sales and learner engagement.
